Hydrogen Bus Demonstration Project

- The PEI Energy Corporation's hydrogen bus demonstration project took place from November 2007 to March 2010.
- The hydrogen bus project was part of a national demonstration program that saw ten Ford hydrogen buses deployed in cities across Canada.
- The Energy Corporation's cost to participate in the demonstration was minimal as the buses were provided by Ford and the fuel and fueling equipment was funded by Natural Resources Canada.
- The purpose of the project was to demonstrate hydrogen as a low emissions transportation fuel, generate data that Ford could use in developing future hydrogen vehicles and provide an opportunity to build local technical capacity for working with hydrogen vehicles and

fueling equipment (an emerging clean energy technology at the time).

- The project also provided benefits through creating awareness of alternative transportation fuel options, familiarizing regulatory agencies with the application hydrogen safety codes and standards, and drawing additional attention to PEI as a leader in clean energy solutions.
- Over the course of the project the buses logged over 32,000 kilometers operating within the fleet of the Charlottetown Transit system.
- Generally, the buses worked well over the demonstration period and the project ended when the funding agreement expired.
